TOWARDS SUSTAINABLE COCOA IN GHANA: FARMERS’ PERSPECTIVES

Mr. Francis Acquah Otu
INTRODUCTION

- Sustainable cocoa production means producing cocoa in a way that does not destroy the ability of future generations to also cultivate cocoa.
- This ability is influenced by actions we take and policies that we pursue today.
- Farmers have a role to play in promoting sustainability through their actions and inactions.
SOME POLICY INTERVENTIONS THAT PROMOTE SUSTAINABILITY

- Cocoa Hi-Tech programme
- Control of cocoa pests and diseases programme (CODAPEC)
- Increases in producer price of cocoa
- Provision of rural infrastructure including roads, schools and hospitals/clinics
- Payment of bonuses
CONSTRAINTS TO SUSTAINABILITY ATTAINMENT

- High cost of inputs including agrochemicals, equipment and labour
- Ineffective public cocoa extension system
- Ageing cocoa farmers
- Constraining land tenure system that makes entry into cocoa for the youth difficult
- Unavailability and high cost of credit to small-scale farmers
WAY FORWARD -1

- Pragmatic policies to increase returns to the farmer

- Provision of effective information support system to farmers

- Establishment of an efficient and effective input delivery system for cocoa farmers

- Establishment of a viable credit system to farmers to enable them manage their farms well
WAY FORWARD -2

- Protection of the forest and the general cocoa environment to enhance new establishment or replanting

- Effective implementation of the regulatory framework to promote safe use of agrochemicals

- Effective utilisation of farmers’ knowledge and skills through their groupings
CONCLUSIONS

- Attainment of sustainable cocoa production is feasible only if pragmatic policies are put in place today.

- The central role of the farmer should be recognised and harnessed.

- It is only through the positive involvement of all relevant stakeholders would sustainable cocoa production be attained.
